

Regulation and Growth

Simeon Djankov, Caralee McLiesh, Rita Ramalho*
The World Bank

March 6, 2005

Abstract

Using objective measures of business regulations in 135 countries, we establish that countries with better regulations grow faster. Improving from the worst quartile of business regulations to the best implies a 2.3 percentage point increase in annual growth.

Keywords: Economic Growth, Business Regulations.

JEL Codes: O12, O17, O50, P48

1 Introduction

Why some countries grow faster than others is one of the most important questions in economics. Solving this puzzle has the obvious appeal of improving the living standards for a significant proportion of the world population. We go further towards answering this question by studying a major determinant of growth: regulations governing business activity.

Hall and Jones (1999) and Acemoglu et al (2001), among others¹, show that institutions are a major determinant of wealth and long-term growth. Countries that had better political and economic institutions in the past are richer today. We add to the literature on institutions and growth by introducing a new measure of institutional quality. The analysis focuses on a particular type of institution: business regulations. We use a new country-level data set to establish the relationship between the burden of business regulations and growth.

2 Data

We use a new database of business regulations created by the World Bank: the Doing Business database available at www.doingbusiness.org. The indicators measure how regulations help or hinder business performance in 135 countries and in seven regulatory areas: starting a business, hiring and firing workers, registering property, getting bank credit, protecting equity investors, enforcing contracts in the courts, and closing a business. The data are based on studies of laws and regulations and surveys of local lawyers, providing a more precise and objective measure of the business environment than other available perceptions-based measures of institutions.

We develop an aggregate index of business regulations by taking the simple average of country rankings (from 1 to 135) in each of the seven topics in the database. We then normalize this index to vary between zero and one. The ranking for each topic is the simple average of rankings for each of the component indicators (Table 1). For example the “starting a business” ranking is the simple average of country rankings on the procedures, time, cost and minimum capital requirements to register a business. Higher values indicate more business-friendly regulations. New Zealand, the United States, Singapore, Hong Kong (China), Australia and Norway score highest. The Democratic Republic of Congo, Burkina Faso, Chad, Laos, Cambodia and Angola score lowest. Brazil, Egypt, and India are also in the lowest quartile.

Data on average annual growth of GDP per capita between 1993 to 2002 come from the World

¹For instance, North (1981), Knack and Keefer (1995), Rodrik (1999).

Bank’s World Development Indicators (WDI). We use the WDI because it covers a larger set of countries than the Penn World Tables² used by Hall and Jones (1999) and Sala-i-Martin et al (2004). All other control variables are also from the WDI, with the exception of Civil Conflict. This binary variable equals 1 if there was any civil conflict³ in the period 1993 to 2002, according to the data in Doyle and Sambanis (2000).

3 Results

We first establish that business regulations are an important determinant of growth, then quantify this result and compare it with other determinants of growth. Following Barro (1991), we test the relation between business regulations and growth using the model below:

$$Growth = \alpha + \beta business_regulations + \gamma Ln(GDPpc93) + \delta X + \varepsilon,$$

where X is a set of control variables⁴ and $Growth$ is the annual average GDP per capita growth rate between 1993 and 2002 in percentage (it can vary from 0 to 100%). The results are presented in Table 2A. The business regulations index and growth are consistently and positively correlated. Countries with less burdensome business regulations grow faster.

To examine the causal link between regulations and growth we use two-stage least regressions. Following La Porta et al (1999), we instrument business regulations with the legal origin of a country’s commercial code or company law, absolute latitude, initial GDP per capita, religion and language. Legal origin has the characteristics of a good instrument for business regulations. It defines substantive and procedural aspects of the law, and therefore is linked to the complexity of business regulations. And it is reasonable to assume that legal origin established centuries ago does not have a direct impact on growth over the last decade. The same applies with the geography and culture variables. Table 2B presents the results. The effect of more business-friendly regulations on growth remains positive and significant in 2SLS regressions, although weaker than in OLS analysis. Tests of over-identifying restrictions are accepted, showing that the legal origin, geography and culture variables are not correlated with ε , and that these variables do not explain growth through some mechanism other than business regulation.

²Alan Heston, Robert Summers and Bettina Aten, Penn World Table Version 6.1, Center for International Comparisons at the University of Pennsylvania (CICUP), October 2002.

³Defined as an internal conflict causing at least 1,000 deaths.

⁴The set of control variables includes: primary and secondary school enrollment in the initial period, absolute deviation from average deflator in initial period, a binary variable for civil conflict, 3 regional dummies (Sub Saharan Africa, Latin America, East Asia), average government consumption as percentage of GDP over the 10 year growth period. We differ from the specification included in Barro (1991) by including civil conflict instead of assassination and revolutions, including a dummy for East Asia (which is present in Barro (1996)), and excluding average investment as percentage of GDP over the 10 year growth period (which is also treated separately in Barro (1996)).

We check the robustness of our results by including several other control variables in the regressions reported in Table 2A. Our results remain significant when controlling for trade, initial period investment, ethnolinguistic fractionalization, latitude, and landlocked countries. Also our results are robust to including the country’s primary religion and language as control variables instead of as instruments. We also try using 5⁵, 15 and 20 year growth rates as well as GDP levels as the dependent variable and our results remain . Analyzing data from the Penn World Tables as used by Barro (1991), Hall and Jones (1999) and Sala-i-Martin et al (2004) does not alter our results, nor does replacing the WDI education data with the one introduced by Barro and Lee (1996).

4 Interpretation

Our results indicate that government regulation of business is an important determinant of growth and a promising area for future research. The relationship between more business-friendly regulations and higher growth rates is consistently significant in various specifications of standard growth models, and more consistently so than other determinants commonly used in the growth literature.

The impact of improving regulations is large. In Table 3, we analyze the magnitude by including dummies for each quartile of the business regulation index in the OLS regressions. Improving from the worst (first) to the best (fourth) quartile of business regulations implies a 2.3 percentage point increase in average annual growth.

Table 3 also compares the impact of improving business regulations with another commonly used determinant of growth: primary school enrollment. Improving from the second worst to the best quartile of countries on primary school enrollment is associated with a 0.9 percentage point increase in growth rates, lower than the effect of business regulations. The effects of improvements in secondary education, inflation, and government consumption are significantly lower than business regulations.

Our results also have significant implications for policy. They suggest that countries should put priority on reforming their business regulations when designing growth policies. Measures of institutions currently used in the growth literature indicate the extent of problems but not how to fix them. By contrast the indicators in the Doing Business database are directly linked to specific reforms. For example the procedures to register a business or property can be cut by combining them at a “one stop shop” for businesses. Establishing a credit bureau or cutting mandated severance pay for workers will also improve performance on the business regulations index. Our findings imply

⁵Although results are weaker for 5-year growth in the specifications that include regional dummies.

that identifying and implementing such reforms can accelerate economic growth.

Table 1: Description of the Variables from the Doing Business Dataset

Topic	Variable	Description
Starting a Business	Entry Procedures	Number of procedures that are officially required for an entrepreneur to start up an industrial or commercial business.
	Entry days	Number of calendar days required to complete all procedures that are officially required for an entrepreneur to start up an industrial or commercial business.
	Entry cost	Cost as percentage of income per capita associated with completing all procedures that are officially required for an entrepreneur to start up an industrial or commercial business.
Hiring and Firing	Entry Minimum Capital	Minimum capital officially required for an entrepreneur to start up an industrial or commercial business, expressed as a percentage of income per capita.
	Labor Regulation Rigidity	Measures the rigidity of three specific components of employment law: difficulty of hiring, hours of work, and difficulty of firing.
Registering Property	Labor Firing Cost	Measures the cost of advance notice requirements, severance payments and penalties due when firing a worker, expressed in terms of weekly wages.
	Property Procedures	Number of procedures that are legally required for registering property transfers.
	Property Days	Number of calendar days necessary for completing all procedures that are legally required for registering property transfers.
Getting Credit	Property Cost	Cost as percentage of the property value associated with completing all procedures that are legally required for registering property.
	Legal Rights	Measures whether collateral and bankruptcy laws provide for 10 features that facilitate lending.
Protecting Investors	Credit Information	Measures rules affecting the scope, access and quality of credit information available through either public or private credit registries.
	Disclosure Index	Measures whether laws and regulations provide for seven ways of enhancing company disclosure of ownership and financial statements.
Enforcing Contracts	Contract Procedures	Number of procedures mandated by law or court regulation for enforcement of commercial contracts through the courts.
	Contract Days	Number of calendar days necessary for completing all procedures mandated by law or court regulation for enforcement of commercial contracts through the courts.
	Contract Cost	Cost as percentage of the contract value associated with completing all procedures mandated by law or court regulation for enforcement of contracts through the courts.
Closing a Business	Recovery rate	Measures the efficiency of foreclosure or bankruptcy procedures by estimating how many cents on the dollar claimants—creditors, tax authorities, and employees—recover from a bankrupt firm.
